

EXPERIMENT 6

Name: Hansika Singhal

UID: 22BET10085

Section: 22BET_IOT-702

Group: A

Subject: Advance Programming

Subject Code: 22ITP-351

Date of Performance: 28/03/2025

Aim: Maximum Depth of Binary Tree

Objective: Given the root of a binary tree, return *its maximum depth*.

A binary tree's maximum depth is the number of nodes along the longest path from the root node down to the farthest leaf node.

Code:

```
class TreeNode:
```

```
    def __init__(self, val=0, left=None, right=None):
```

```
        self.val = val
```

```
        self.left = left
```

```
        self.right = right
```

```
class Solution:
```

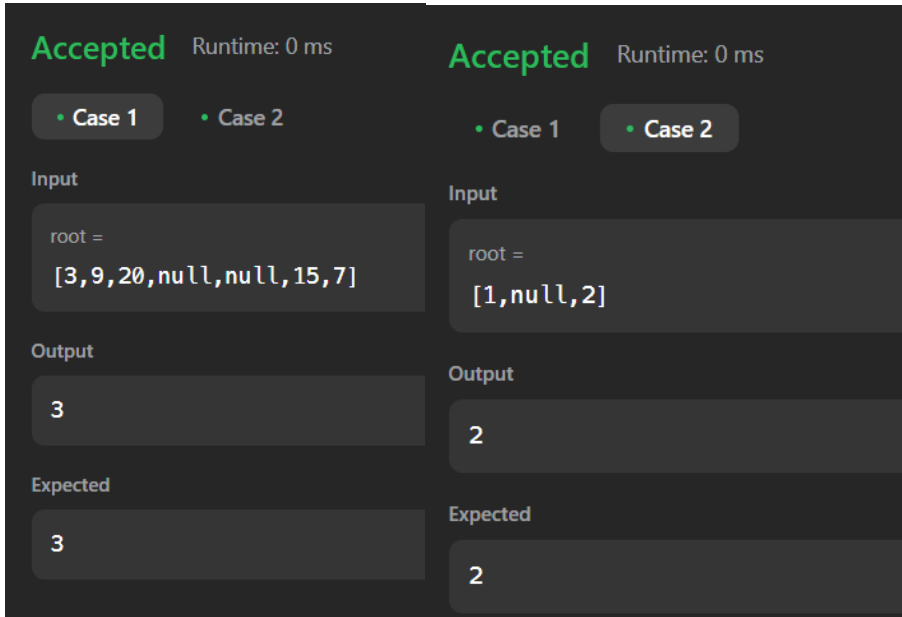

```
    def maxDepth(self, root):
```

```
        if not root:
```

```
            return 0
```

```
left_depth = self.maxDepth(root.left)
right_depth = self.maxDepth(root.right)
return max(left_depth, right_depth) + 1
```

Output:

Case	Input	Output	Expected
Case 1	root = [3,9,20,null,null,15,7]	3	3
Case 2	root = [1,null,2]	2	2

Aim: Validate Binary Search Tree

Objective: Given the root of a binary tree, *determine if it is a valid binary search tree (BST)*.

A valid BST is defined as follows:

- The left subtree of a node contains only nodes with keys less than the node's key.
- The right subtree of a node contains only nodes with keys greater than the node's key.
- Both the left and right subtrees must also be binary search trees.

Code:

```
class TreeNode:
```

```
    def __init__(self, val=0, left=None, right=None):  
        self.val = val  
        self.left = left  
        self.right = right
```

```
class Solution:
```

```
    def isValidBST(self, root, low=float('-inf'),  
high=float('inf')):
```

```
        if not root:
```

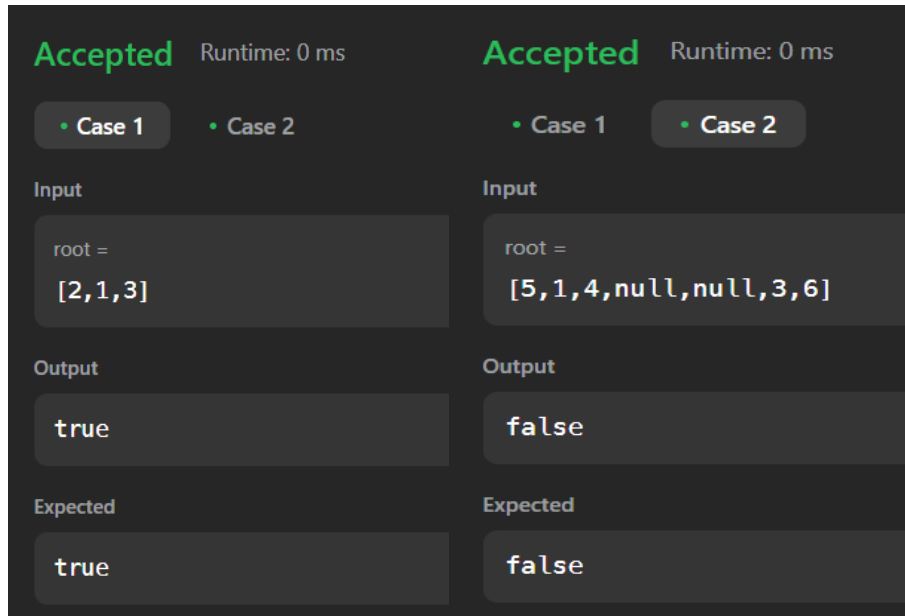

```
            return True
```

```
        if not (low < root.val < high):
```

```
            return False
```

```
        return (self.isValidBST(root.left, low, root.val) and  
                self.isValidBST(root.right, root.val, high))
```

Output:

Aim: Symmetric Tree

Objective: Given the root of a binary tree, *check whether it is a mirror of itself* (i.e., symmetric around its center).

Code:

class TreeNode:

```
def __init__(self, val=0, left=None, right=None):  
    self.val = val  
    self.left = left  
    self.right = right
```

class Solution:

```
def isSymmetric(self, root):  
    if not root:
```

```
return True
```

```
def isMirror(t1, t2):
```

```
    if not t1 and not t2:
```

```
        return True
```

```
    if not t1 or not t2:
```

```
        return False
```

```
    return (t1.val == t2.val and
```

```
            isMirror(t1.left, t2.right) and
```

```
            isMirror(t1.right, t2.left))
```

```
    return isMirror(root.left, root.right)
```

Output

Accepted Runtime: 0 ms	Accepted Runtime: 0 ms
<ul style="list-style-type: none">• Case 1• Case 2	<ul style="list-style-type: none">• Case 1• Case 2
Input	Input
root = [1,2,2,3,4,4,3]	root = [1,2,2,null,3,null,3]
Output	Output
true	false
Expected	Expected
true	false

Aim: Binary Tree Level Order Traversal

Objective: Given the root of a binary tree, return *the level order traversal of its nodes' values*. (i.e., from left to right, level by level).

Code:

```
from collections import deque
```

```
class TreeNode:
```

```
    def __init__(self, val=0, left=None, right=None):
```

```
        self.val = val
```

```
        self.left = left
```

```
        self.right = right
```

```
class Solution:
```

```
    def levelOrder(self, root):
```

```
        if not root:
```

```
            return []
```

```
        result = []
```

```
        queue = deque([root])
```

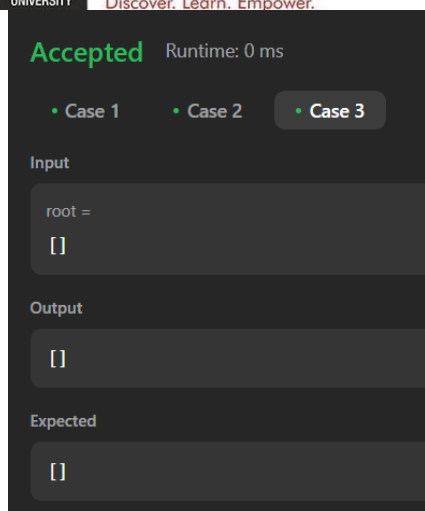

```
        while queue:
```

```
level = []  
  
for _ in range(len(queue)):  
    node = queue.popleft()  
    level.append(node.val)  
    if node.left:  
        queue.append(node.left)  
    if node.right:  
        queue.append(node.right)  
    result.append(level)
```

return result

Output:

Accepted	Runtime: 0 ms	Accepted	Runtime: 0 ms
<ul style="list-style-type: none">• Case 1• Case 2• Case 3		<ul style="list-style-type: none">• Case 1• Case 2• Case 3	
Input root = [3,9,20,null,null,15,7]		Input root = [1]	
Output [[3], [9,20], [15,7]]		Output [[1]]	
Expected [[3], [9,20], [15,7]]		Expected [[1]]	

Aim: Convert Sorted Array to Binary Search Tree

Objective: Given an integer array `nums` where the elements are sorted in ascending order, convert *it to a height-balanced binary search tree*.

Code:

```
class Solution(object):
```

```
    def sortedArrayToBST(self, nums):
```

```
        if not nums:
```

```
            return None
```

```
        mid = len(nums) // 2
```

```
        root = TreeNode(nums[mid])
```

```
        root.left = self.sortedArrayToBST(nums[:mid])
```

```
        root.right = self.sortedArrayToBST(nums[mid+1:])
```

```
        return root
```

Output:

Accepted Runtime: 0 ms	Accepted Runtime: 0 ms
<ul style="list-style-type: none">• Case 1• Case 2	<ul style="list-style-type: none">• Case 1• Case 2
Input nums = [-10,-3,0,5,9]	Input nums = [1,3]
Output [0,-3,9,-10,null,5]	Output [3,1]
Expected [0,-3,9,-10,null,5]	Expected [3,1]

Aim: Binary Tree Inorder Traversal

Objective: Given the root of a binary tree, return *the inorder traversal of its nodes' values*.

Code:

```
from collections import deque
```

```
class TreeNode(object):
```

```
    def __init__(self, val=0, left=None, right=None):
```

```
        self.val = val
```

```
        self.left = left
```

```
        self.right = right
```

```
class Solution(object):
```

```
    def inorderTraversal(self, root):
```

```
        result = []
```

```
        stack = []
```

```
        current = root
```

```
        while current or stack:
```

```
            while current:
```

```
                stack.append(current)
```

```
                current = current.left
```

```
            current = stack.pop()
```

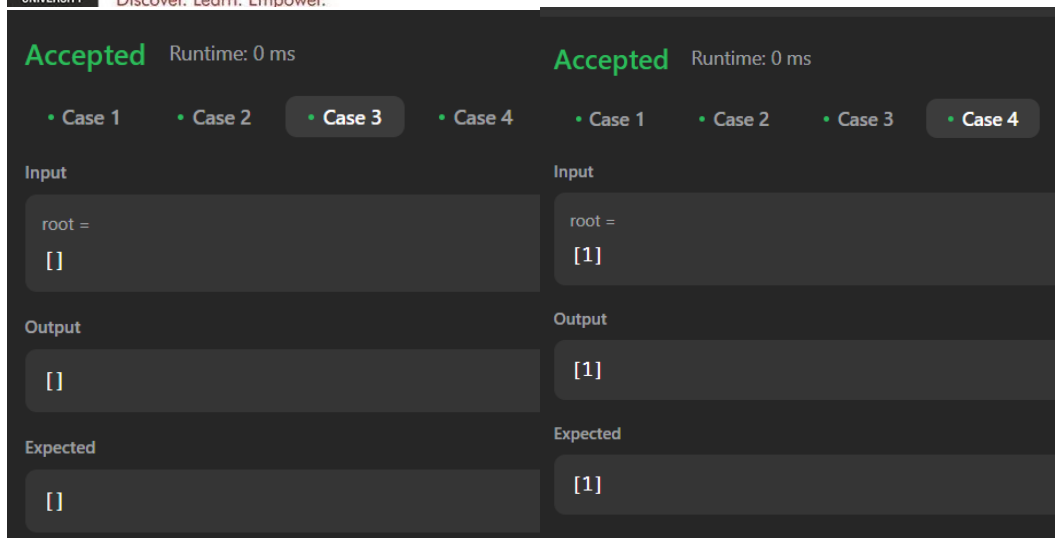

```
            result.append(current.val)
```

```
            current = current.right
```

```
        return result
```

Output:

Accepted	Runtime: 0 ms
• Case 1	• Case 2
Input	Input
root = [1,null,2,3]	root = [1,2,3,4,5,null,8,null,null,6,7,9]
Output	Output
[1,3,2]	[4,2,6,5,7,1,3,9,8]
Expected	Expected
[1,3,2]	[4,2,6,5,7,1,3,9,8]

Aim: Construct Binary Tree from Inorder and Postorder Traversal

Objective: Given two integer arrays inorder and postorder where inorder is the inorder traversal of a binary tree and postorder is the postorder traversal of the same tree, construct and return *the binary tree*.

Code:

```
class Solution(object):
    def buildTree(self, inorder, postorder):
        if not inorder or not postorder:
            return None
        root_val = postorder.pop()
        root = TreeNode(root_val)
        root_index = inorder.index(root_val)
        root.right = self.buildTree(inorder[root_index + 1:],
postorder)
```

```

root.left = self.buildTree(inorder[:root_index],
postorder)

return root

```

Output:

Accepted	Runtime: 0 ms	Accepted	Runtime: 0 ms
• Case 1	• Case 2	• Case 1	• Case 2
Input inorder = [9, 3, 15, 20, 7] postorder = [9, 15, 7, 20, 3]		Input inorder = [-1] postorder = [-1]	
Output [3, 9, 20, null, null, 15, 7]		Output [-1]	
Expected [3, 9, 20, null, null, 15, 7]		Expected [-1]	

Aim: Kth Smallest element in a BST

Objective: Given the root of a binary search tree, and an integer k, return *the kth smallest value (1-indexed) of all the values of the nodes in the tree.*

Code:

```

class TreeNode(object):

    def __init__(self, val=0, left=None, right=None):

        self.val = val

        self.left = left

```

```
self.right = right
```

```
class Solution(object):  
    def kthSmallest(self, root, k):  
        stack = []  
        while True:  
            while root:  
                stack.append(root)  
                root = root.left  
            root = stack.pop()  
            k -= 1  
            if k == 0:  
                return root.val  
            root = root.right
```

Output:

Accepted	Runtime: 0 ms	Accepted	Runtime: 0 ms
• Case 1	• Case 2	• Case 1	• Case 2
Input		Input	
root = [3,1,4,null,2]		root = [5,3,6,2,4,null,null,1]	
k = 1		k = 3	
Output		Output	
1		3	
Expected		Expected	
1		3	

Aim: Populating Next Right Pointers in Each Node

Objective: You are given a perfect binary tree where all leaves are on the same level, and every parent has two children. The binary tree has the following definition:

```
struct Node {  
    int val;  
    Node *left;  
    Node *right;  
    Node *next;  
}
```

Populate each next pointer to point to its next right node. If there is no next right node, the next pointer should be set to NULL.

Initially, all next pointers are set to NULL.

Code:

```
class Node(object):  
    def __init__(self, val=0, left=None, right=None,  
next=None):  
        self.val = val  
        self.left = left  
        self.right = right  
        self.next = next
```

```
class Solution(object):
```

```
    def connect(self, root):
```

```
        if not root:
```

```
            return None
```

```
        leftmost = root
```

```
        while leftmost.left:
```

```
            head = leftmost
```

```
            while head:
```

```
                head.left.next = head.right
```

```
                if head.next:
```

```
                    head.right.next = head.next.left
```

```
                head = head.next
```

```
            leftmost = leftmost.left
```

```
        return root
```

Output:

Accepted Runtime: 19 ms	Accepted Runtime: 19 ms
<ul style="list-style-type: none">• Case 1• Case 2	<ul style="list-style-type: none">• Case 1• Case 2
